Key Features A drawing in AutoCAD is called a project, which is similar to a file in some other CAD systems. A project can consist of one or more drawings. On the left side of the screen are the various drawing views available. When you click on a view, it will expand to fill the entire screen. On the right side of the screen, you can view: Drawing views: It includes the current drawing, a thumbnail of other open drawings, which is the same as the "Project browser", the Start/New drawing

page, the context menu, the Snap and Select features, and the Layer Control and Attributes windows. Panes : Each drawing view consists of one or more panes, which are typically divided into the various drawing types, such as linework, geometric objects, and text. The individual panes have controls associated with them, as well as scroll bars, which can be used to scroll through the drawing data. : Each drawing view consists of one or more panes, which are typically divided into the various drawing

Properties: There are many properties associated with any shape, such as the name, linetype, color, size, and other graphics attributes. Properties are read-only, but you can make changes to them. You can change the properties of objects in a drawing view to another property type or in a different order. Feature interdependency AutoCAD does not require a Microsoft Windows operating system. Instead it is portable, running on a number of platforms including but not limited to: Microsoft Windows, macOS, iOS, Android, Unix and more. Architecture As with most CAD software, AutoCAD is primarily

used for design-related workflows.

However, it is also used for construction documentation and analysis purposes. AutoCAD, like most other CAD software, is most effective for designers and architects. However, others are also employed in the AutoCAD software's field of use. They include: CAD drafting CAD drafting is the most common use of AutoCAD. Drafting is one of the most time-consuming and tedious activities in the design process. It requires the designer to enter information regarding objects into the drawing at a very high rate. AutoCAD is used to automate this process, moving objects into and out of the drawing for the designer. In addition, it can be used to store the information from these

drafting activities so that it can be updated and re-used in different drawings. The initial release of AutoCAD did not offer any support for the creation of objects, such as drawings, through the use of programming. Rather, it provided a graphical interface for users to create drawings. From that point on, programming began to play a greater role in the design process. CAD construction is the use of AutoCAD for the construction process, from design, construction, and management, to construction management. It is used to build a model or geometry and place it into the drawing area. It is primarily used to store the information that is used in construction of the design. CAD

analysis CAD analysis is the use of AutoCAD for the analysis process. In this process, the computer is used to model a three dimensional object and store all the information within the model. In addition, it can be used to calculate and present the data. This allows for the user to be able to make changes in the design without having to create a new drawing. Other uses AutoCAD is also used for the following purposes: CAD training CAD training is the use of AutoCAD for the training of new users in the AutoCAD software. It can be used to train new users by providing a virtual CAD environment to them. It can be used in conjunction with other systems, such as Autodesk Studio. CAD data exchange CAD data
