Q: Linking an already existing C/C++ shared library in Windows? I have a C/C++ shared library that I can compile and successfully run. It can be used from C/C++ code compiled in Windows and Linux. I would like to use it also in a Windows program. How should I proceed? For example, should I move the .so file in the same directory where the Windows program is run?

A: You can always link against the .so files if you wish. You will need to pass the `-D_WINDLL` flag to your compiler and linker.

A: Linking against a library does not mean that the lib was loaded. To load a lib into a process you have to link it with the `-static-libgcc` option. You should add that to your linker options. You can also link against the .dll or .lib file directly. If the .dll is present then the lib will be automatically loaded. If the lib file is not present then it will not be loaded, but you can load the lib anyway, you don't have to.
