For some reason, I can't seem to find any documentation on how to declare static methods in C#. They seem to work just fine, but I can't find any documentation on how to declare them. I need to create static methods, like they are defined in C++, so how can I declare them in C#? A: There are ways to do this, depending on what you actually need the methods for. But a C++ static method is something similar to a C# static method, but with a few differences. A static method is one that does not have a this pointer at all. So the only place it will be used is within the class where it is defined. Since you can never take the this pointer outside of the class where the method is defined, it is a really awkward usage of static methods. In other words, a C# static method is really just a method that is defined in a class, but is not a member function of any class. The second thing that's different is that static methods in C++ do not have access to private, protected, or public members of the class they are defined in. You can not access the private members of a class unless you are given access to that class by an object of type that class. That's not really a big deal when it comes to static methods in C#. The last thing that's different is that static methods in C++ have a specific storage allocation. When you define a method in a class, it occupies space on the stack. When you define a static method, it is allocated on the heap (after all, C# does not support stack-based allocation in that case, do to the fact that methods don't really have a this pointer). For the methods that you define in C# that are static, if the method is static, then it is allocated on the stack. In both cases, there are ways that you can declare static methods in C#. If you need them to be accessible across the whole

I want to be able to encrypt it before I publish the app to make it unreadable/unhackable in the future. Is there a way of doing that from inside the application? I could always put the keys in a web page, then copy/paste them on the app, but I feel it's a bad idea. A: You can use a secret key for encryption. This is used in encryption protocols like SSL. This key is saved inside your application and when you need to decrypt a message, you request a
