Microsoft Windows API Microsoft's Windows API is an industry-standard set of application programming interface (API) definitions for the Microsoft Windows operating system. The Windows API allows programs, for example, to automate various operations such as launching applications and controls, reading and writing files and data, displaying dialog boxes, controlling processes, and communicating over a network. It is based on a common model of how programs should work, and is therefore a large programming language on its own. The programming language is powerful and flexible, and can be used for many kinds of programming tasks. Microsoft Windows API documentation is distributed in a programming manual. The standard programming manual is also available on-line. The most commonly used portion of the programming manual is the Programming Reference. The Programming Reference shows the names and usage of functions and contains brief descriptions. There are other sections, such as the Shell Functions and the Windows Automation Functions, which are less commonly used. APIs as Middleware A number of APIs are provided as a component of a larger software solution. For example, the Windows API is available as part of the.NET Framework. The Visual LISP language was developed as part of Lotus SmartSuite, and is now available as a stand-alone product. One of the goals of the OpenOffice.org project is to produce an open source office suite. It includes a large number of APIs for automating aspects of office suite functions. In the following sections, we list some APIs as middleware products. Each of the APIs listed are accessible through an appropriate programming language.
