Gender and racial disparities in osteoporosis and fracture prevention. Osteoporosis and fragility fractures are a growing epidemic in the United States. Reversing this epidemic requires attention to the underlying reasons for these disparities. Osteoporosis and fragility fractures disproportionately affect women and minorities, especially minority women. Some literature suggests that these disparities are related to higher prevalence of osteoporosis in minority women and higher mortality rate in minorities after fragility fracture, as well as lower levels of physical activity and poorer diet. Although numerous studies have examined osteoporosis and fragility fracture, few have focused on the role of gender and race. This paper will review the current literature regarding osteoporosis in minority populations and discuss implications for the prevention and treatment of osteoporosis in these populations. Open access is key to reducing the costs for accessing health care in the United States. The goal of this proposal is to enhance the Open Access to Clinical Data (OaCAD) Research Program created and supported by the National Health Information Network (NHIN) to expand the provision of clinical data resources for researchers, advanced practitioners and other health professionals who use linked clinical datasets. Because of the high cost of interlibrary loan, and its structural impediments to the spread of knowledge, the current system for OaCAD is not adequate to meet researchers' needs. The NHIN OaCAD program is using linked clinical datasets to improve our understanding of issues that influence health care delivery, and to guide implementation of the clinical, payment and policy reforms that are needed to improve access to and quality of care for all Americans. Achieving the goals of the program will be facilitated if researchers can access linked clinical datasets without the requirement for interlibrary loan. The specific aims of the program are to: 1) facilitate access to high-quality linked data for observational research, 2) increase the OaCAD program's impact, and 3) expand the types of linked datasets available to researchers using federal grants for which linked data are a requirement. To accomplish these aims, we propose to establish NHIN Information Services (NIS) as a national clearinghouse for OaCAD datasets, and to develop an interface for accessing and using them. For this application, we will use existing linked clinical datasets: the Microsoft(r) Corporation's SQL Server Compact (SSC) database deployed through a web portal; the National Centers for Biotechnology Information's PubMed database; and the Children's Hospital of Philadelphia's MedV

Q: What is the current S.A.D. of the Universe? I can't seem to find the answer to this question. It seems to be something that is already known (or that doesn't need to be measured). What is it? A: The most common figure I've seen for the size of the Universe is 2×10^{10} cm. This is also the size used by Wikipedia for the radius of the observable Universe, but if you look at the definition for the observable Universe, it is defined as $R = \int_0^t \frac{c}{a(t)} dt$ where a is the scale factor of the Universe. I think the confusion you may have is that the 2 in the above unit is really just an arbitrary proportionality constant that can be changed to a more convenient value if so desired. This unit value is chosen for convenience. With an assumed matter density $\Omega_m = 0.3$ and a Hubble constant of $H_0 = 70$ km/s/Mpc, the Universe is approximately 15 Gpc across, and the Hubble radius is about 3000 Mpc. So it is convenient to work in units of 10^{10} cm. Of course this is not really an observable radius, it is something that we (or even the Hubble radius) use to describe the Universe. If you want to measure the actual radius, you need a ruler. Astronomers don't, so I'm not sure that there is a meaningful answer. Kubica: 'I can't drive F1 car' Kubica feels he's grown out of Formula 1 and that he can't "drive an F1 car", which is where he sees his future lies. The Polish driver of a Ligier JSP2 lost his life while racing at the 2003 San Marino Grand Prix. His best result that season came at Monaco. Kubica and his Williams team-mate Mark Webber collided in the first corner, which left the Pole with serious injuries to the head and lower body, including a fractured skull and leg. "I think for me it's quite clear that I had used all my life to race cars," Kubica told WOZA. "And I feel like I'm already finished. "For me
