A general approach to propargyl 6-substituted purines (aromatic and aliphatic variants) is described. This approach relies on intramolecular cyclization of the allylamine to furnish the requisite pentacyclic system. The primary issues associated with this approach are the regiochemical outcome of the propargylation reaction and the stereochemical course of the intramolecular cyclization. We address these issues by controlling the regiochemistry of the

propargylation reaction by the use of halide tethers to block formation of the undesirable ortho-substituted allylamine isomer. Control of the stereochemical course of the cyclization is achieved through the use of active esters. Finally, we have developed an original and flexible approach to purines by the regioselective propargylation of an aldoxime and subsequent oxidative cyclization.Q: Detecting device orientation changes in Android How can I detect and save device orientation changes in Android? I need to detect whether the device is rotated and then save the orientation as well as date/time. I need this to work even if the user changes the orientation manually. The user should not be able to change the orientation of the device if device orientation is set to any orientation other than portrait. A: In Android 3.0+ that data is automatically persisted in /data/data/com.example.myapp/shared_prefs/on_rotation.xml If you look at the manifest xmlns:data="" you should be able to monitor the rotation_90 and rotation_270 constant in your android manifest Example: import com.example.myapp.R;
