Behavioral and cognitive consequences of repeated oral administration of quinpirole in the rat. In the present study, the motor and cognitive effects of the selective dopamine D2/D3 receptor agonist quinpirole was investigated in rats. The animals were trained to run a variable inter-trial interval (1.5-10 s) to obtain food in a two-lever operant task. The rats received repeated daily oral administration of a range of quinpirole doses (0.0075-0.5 mg/kg) for 10 consecutive days. Quinpirole administration was found to produce a dose-dependent increase in the number of lapses of operant performance and an impaired ability to retain the learned task. Moreover, quinpirole induced a dose-dependent disruption of learning and memory that was reflected in a progressive decrease in the accuracy of discrimination of one of the levers, which increased the number of non-selective responses (i.e. switches) across trial days. Quinpirole increased the rate of pedal activity in a dose-dependent fashion. The doses of quinpirole that produced the largest disruption of operant performance also produced the most marked increase in the rate of pedal activity. Quinpirole did not alter the ability of the animals to perform a control discrimination (i.e. choose lever A when there was an implicit stimulus, and lever B when there was an explicit stimulus). The results are discussed in terms of the ability of repeated oral administration of quinpirole to mimic dopamine depletion in the central nervous system. So I guess, FFmpeg is the final problem solved. Please remember, you should try to use the current patch version of the FFmpeg to avoid problems.
