Sonenberg, Roland Bock, Rainer Wolf-DietrichAndroid uses the term "background tasks" for services that run outside the user's UI. While these services are running in the background they are supposed to report results and other information in a way that the user could easily notice. There are different ways to implement background tasks in Android: As the developer you create a service class or an activity. Both classes need to implement onCreate(), onStartCommand() and onDestroy(). Usually, these three methods are used to start a service, execute an action and stop it. So far this behavior is only possible with

Android 2.x and above. Starting a service is one approach, but it has some problems. Most notably the code inside an activity and the service classes cannot communicate. Sending messages between them is not possible. The d41b202975

HD Pixelarium HD is a free and open source mobile OGL viewer for mobile devices. It was released on 20th September 2011. Using the OpenGL ES programming interface, pixelarium HD can be used on all devices based on Android 2.2 and higher OS. It has been under continuous development since the first iPhone release in 2007 and it was the first free and open-source cross-platform 3D engine to be released. Pixelarium HD can be used as a 3D desktop viewer to full screen mobile optimized canvas (canvas, jumping) or as a mobile 3D game engine that can be experienced on all platforms except iOS. The engine can be used both to create games that can be played in a browser on Android devices and Desktop computers as well as standalone apps. Pixelarium HD is a community-driven software project based on Mozilla's Gecko Engine. The engine had a compiler called "calc" (now dead) that allowed users to take existing OpenGL ES applications created by application programmers and compile them for the Calc backend to enable them to run on the Pixelarium HD engine. Features Pixelarium HD includes a plugin system that gives the developers the ability to extend the features of the engine; the plugin system can be used to add improved input methods (including gestures), new shader languages (such as SSAO), and also to create new contents themselves (such as textures and collages). Pixelarium HD is based on version 2 of the open-source OpenGL ES specifications. It runs on the following operating systems: Android, iOS (iPhone & iPod Touch), BlackBerry, Symbian and Windows Mobile 7 (though Pixelarium HD is not multiplatform). Pixelarium HD runs entirely on pure Java technologies with a primary focus of portability. This allows the engine to run on all platforms where Dalvik can run. There is no official Mac OS X port yet. Support for iOS has been developed by developer leis51;

porting Pixelarium HD to iOS and running it on the iPhone through the simulator already supports OpenGL ES 1.1. Support for Android has been developed by iSunn; it includes emulator versions of Pixelarium for Android Devices. Pixelarium HD has a pure Java API that supports the XML based interface. Currently, access to the user interface and other state information can be queried from the engine through the "view" sub-object of the "object" attribute. This is used to access all graphical attributes of the OpenGL objects that the viewer provides
