Free image editors are often included with operating systems.

These editors are all relatively simple and are good for basic image tasks, such as creating, resizing, and cropping. The following list shows you some of the free editors that are included with Linux. GIMP GIMP (GNU Image Manipulation Program) ([www.gimp.org](http://www.gimp.org)) is one of the best-known free image-editing programs, and it is available for Linux,

---

Windows, and Mac operating systems. The program's most distinctive features are its advanced selection tools (used in the same way as the likes of Photoshop's Magic Wand) and the comprehensive array of features that a user can apply to an image. For example, tools available are a selection brush, a gradient filter, a text tool, and a content-aware brush. In addition, the GIMP has an extensive set of tutorials to teach users how to perform a huge array of effects, including painting with live video as a paint source. With GIMP, you can create, edit, and enhance images with the most cutting-edge features available. Adobe Photoshop Elements Adobe Photoshop Elements

([www.adobe.com/products/photoshop-elements.html](http://www.adobe.com/products/photoshop-elements.html)) is the most popular image-editing program for home computers and offers a range of good-quality effects. It does not have all of the features of the full-feature Photoshop, but it offers enough that many users, especially those who don't want to use Photoshop, are able to do a number of simple tasks. Adobe Photoshop Elements also has a free edition with limited functionality that is designed for those who simply want to crop and resize images, along with other basic operations. If you want to edit and work with RAW images, you need to use a RAW-based editor such as Capture One. See Book IV Chapter 4 for more details. ImageMagick

---

ImageMagick ( is a free and open-source tool for creating, editing, and converting images. It is known as one of the best cross-platform image editors. It includes features for editing images and performing the basic operations of image processing, such as rotating, scaling, adjusting the red, green, blue, and white balance settings, converting from one file type to another, and printing. ImageMagick supports a wide range of file formats and can be used to produce JPEG, TIFF, GIF,

Tonganoxie, KS, I hope you aren't hanging your head in shame, as I'm sure you have something great to be showing off. This started out as a joke, but the more I read the more I started to see a real need for this tool. I was kidding about the shame, but after I read the OP's list of items I thought, "hey, this is a tool I need." If my list reads anything like yours then I'm very interested in this. I already have source control (Subversion, but that's not specific to anyone). Since I know where everything is already I figured I'd build it myself. When you think about it, a nice place to put this is a

---

small "IDE" with a nice GUI. I haven't implemented it yet, but it's already possible to work with a lot of source. I'd like to be able to step through the code and see it as I'm typing in it, if possible. There are so many ways to do this that I was planning on implementing one of them, but I'll probably end up implementing my own since it's a unique need. I can't wait to see where this goes and I may be posting this to the web site. Here's hoping it goes well. There's a few good reasons to store source code in a source code control system. Version control is a good example of this. Another good example is website development, both for full blown web sites as well as one-off, one page sites. What I

---

want is something like with Subversion, but with the following features: - versioned by file (ideally, there should be no need to even have a -directory) - files can be versioned or be left unversioned - files can be locked (no changes, and can not be modified) - can specify specific "repository" lock/edit/etc. permissions for - specific users If I was in the market for a source code control system, this is probably what I'd be looking for, but unfortunately it's not very well supported right now. I think it would be interesting if a version control system such as Subversion allowed the source code to be versioned and mapped to a directory. This would mean that it
