What's the Purpose of AutoCAD? The purpose of AutoCAD is to allow designers to create and manage drawing files. For the most part, AutoCAD does a very good job at this. It is one of the most widely used CAD tools in the world and is considered to be a better alternative to D3D, GDI and WGL for most types of 2D design. Most people are familiar with AutoCAD; we know how to use it in a certain context, but we are not so sure that they understand how CAD or computer aided design (CAD) works. In fact, it's fairly easy to use AutoCAD, and even complex CAD design projects can be accomplished with a minimum amount of training. For more information about the basic concept of CAD, see "What Is CAD?" below. 2. What's the Typical Workflow? Typical workflows for AutoCAD include: Create a new drawing, edit an existing drawing, close a drawing, and open a new drawing. Create a new drawing: Use the'start' command to open the AutoCAD software application on your computer. Select the command 'NEW'. You will be prompted to enter a name for the new drawing. You may want to create a new folder to hold the new drawing. You can press 'c' to create a new folder, or select an existing folder from your computer. You are now ready to draw, but there are still some options you can set. You can control the number of title blocks in the title block window, and choose the number of layers in the ribbon menu. When the drawing window is opened, you can also choose to give your drawing a drawing number, and a title. The new drawing is now open and ready to use. Using an existing drawing: Use the 'open' command to open the AutoCAD software application on your computer. Select the command 'OPEN'. You will be prompted to select an existing drawing. Select the drawing you want to use from your computer. You can

Q: Confusion in using multiple tables in mysql I have a confusion in how to use multiple tables in mysql. Lets say I have a table called Product and another called ProductAttributes So for a single product, I would have a row with id, product_id, attributes_id and attributes_value. In my use case, the ProductAttributes table is quite small, only about 5 rows. In my db, the tables would be of the form product_id product_attributes_id product_attributes_value Now, I have the need to pull all the attributes for a product. So in the end, I would need a query that would output all the attributes for a product. I was thinking something like SELECT * FROM product JOIN product_attributes ON product_attributes.product_id = product.id However this is giving me an error Unknown column 'product_attributes.product_id' in 'on clause'. and if I did this SELECT * FROM product JOIN product_attributes ON product.id = product_attributes.product_id Then I will get a single row, since product_attributes.product_id is only one and is the same as product.id A: The ON clause doesn't support JOINs, but it does support simple equality conditions like WHERE product.id = product_attributes.product_id. That will still be fine for a small number of rows in product_attributes, though: SELECT product.* FROM product JOIN product_attributes ON product.id = product_attributes.product_id WHERE product_attributes.product_id = @product_id; You can also do a JOIN as long as you use parentheses to group the multiple conditions. Here is a link to a resource about JOINs, but it's actually a bit more complicated than the above example:
