Oral health status and periodontal tissue destruction is associated with systemic conditions, such as diabetes mellitus and cardiovascular diseases. The aim of this study was to investigate the association between oral health and periodontal tissue destruction and systemic conditions in children and adolescents with systemic conditions. The periodontal condition, oral health status and complications of systemic diseases were examined in 57 children and adolescents (mean age 13.4 ± 3.0 years) with chronic disease. The oral health status was investigated using the methods recommended by the World Health Organization (WHO). The mean gingival index (GI), probing depth (PD), level of plasma fibrinogen (FIB) and platelet count (PLT) were also examined. Clinical examination showed that the mean GI was 0.14 ± 0.16 and PD 1.66 ± 0.63 mm, while FIB and PLT were 2.68 ± 0.67 g/L and $219.11 \pm 67.65 \times 10^9/L$, respectively. The mean SI and CAL were 0.78 ± 0.34 and 2.75 ± 1.75 mm, respectively. The mean values of FIB and PLT were significantly higher (p < 0.05).
